About Me

Elizabeth Leonny Efendi

Enthusiastic and driven Data Science and Business Analytics student from Indonesia, looking to expand my analytical skills and knowledge in a real-world setting. Eager to contribute to a dynamic team, leverage data-related skills, and gain hands on experience.

Research Paper: Clinical Decision Support System

3.1 CDSS Mechanisms

The CDSS processes are complex since it evaluates a large amount of patient data, aligning it with medical literature, case histories, and additional information through advanced algorithms. CDSSs are typically classified into knowledge-based and non-knowledge-based.

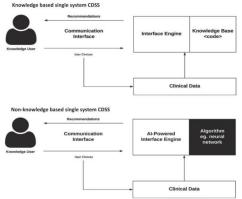

Figure 1: Interactions in knowledge-based and non-knowledge-based CDSS.

Knowledge-based CDSSs employ logical procedures to provide suggestions to help physicians. There will always be knowledge sources and rules obtained from medical literature, patient-centered procedures, guidelines, and expert knowledge. It is commonly used to handle complex decision-making cases. Meanwhile, non-knowledge based CDSSs use complex algorithms to make medical decisions and are usually used when a medical case has not explicitly happened in any past scenarios. One of the algorithms used is neural networks, which is a branch of Al to teach computers the way the human brain processes information and learns.

3.3.3 Reliability of Data

The reliability of data is crucial for providing high-quality patient care and making informed decisions. Some research found that patient data from EHRs are not entirely accurate, which is likely due to a lack of EHR usability (Dash et al., 2019). However, maintaining data reliability is a significant challenge. To input and update data manually requires time and energy, and is prone to errors, leading to inaccurate and incomplete data.

Conducting routine data audits can assist in verifying the precision and accuracy of the data. Also, healthcare providers might use automated data input and update processes to reduce errors and save time and energy. This includes using data import and export tools, integrating data systems, and implementing automated workflows.

	Mean Completeness Score	Mean Correctness Score
Hip Pain	.39	.91
Shoulder Pain	.32	.94
Knee Pain	.37	.96
Foot Pain	.30	.95
All cases combined	.34	.94

Figure 7: Completeness and Correctness Scores

Research conducted by internal medicine residents (PGY-1-3), shows that the core issue is completeness of data. Of the six elements, the data entered is only 30%-40% of the total data that should be entered. However, the data's average accuracy rate of 94%.

5.1 Strategic Planning

Strategic planning plays a crucial role in outlining the course of an organization and deciding how to allocate its resources to pursue that path (Reynolds, G.W., 2016). Implementation of CDSS can be classified as a growth or innovation project, which generates significant new revenue for the organization while exploring the use of new technology in a new way at the same time. With strategic planning, healthcare organizations can align their CDSS initiatives with their overall business objectives such as enhancing customer satisfaction and defining pricing strategies to sustain a competitive edge. Analyzing user feedback and satisfaction ratings can reveal areas for improvement in CDSS offerings. Furthermore, the CDSS market is expected to experience substantial growth in the future. Healthcare organizations can analyze data on the adoption rates of CDSS to inform pricing strategies.

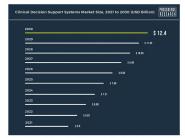

Figure 8: CDSS Market Size Prediction
